Introduction

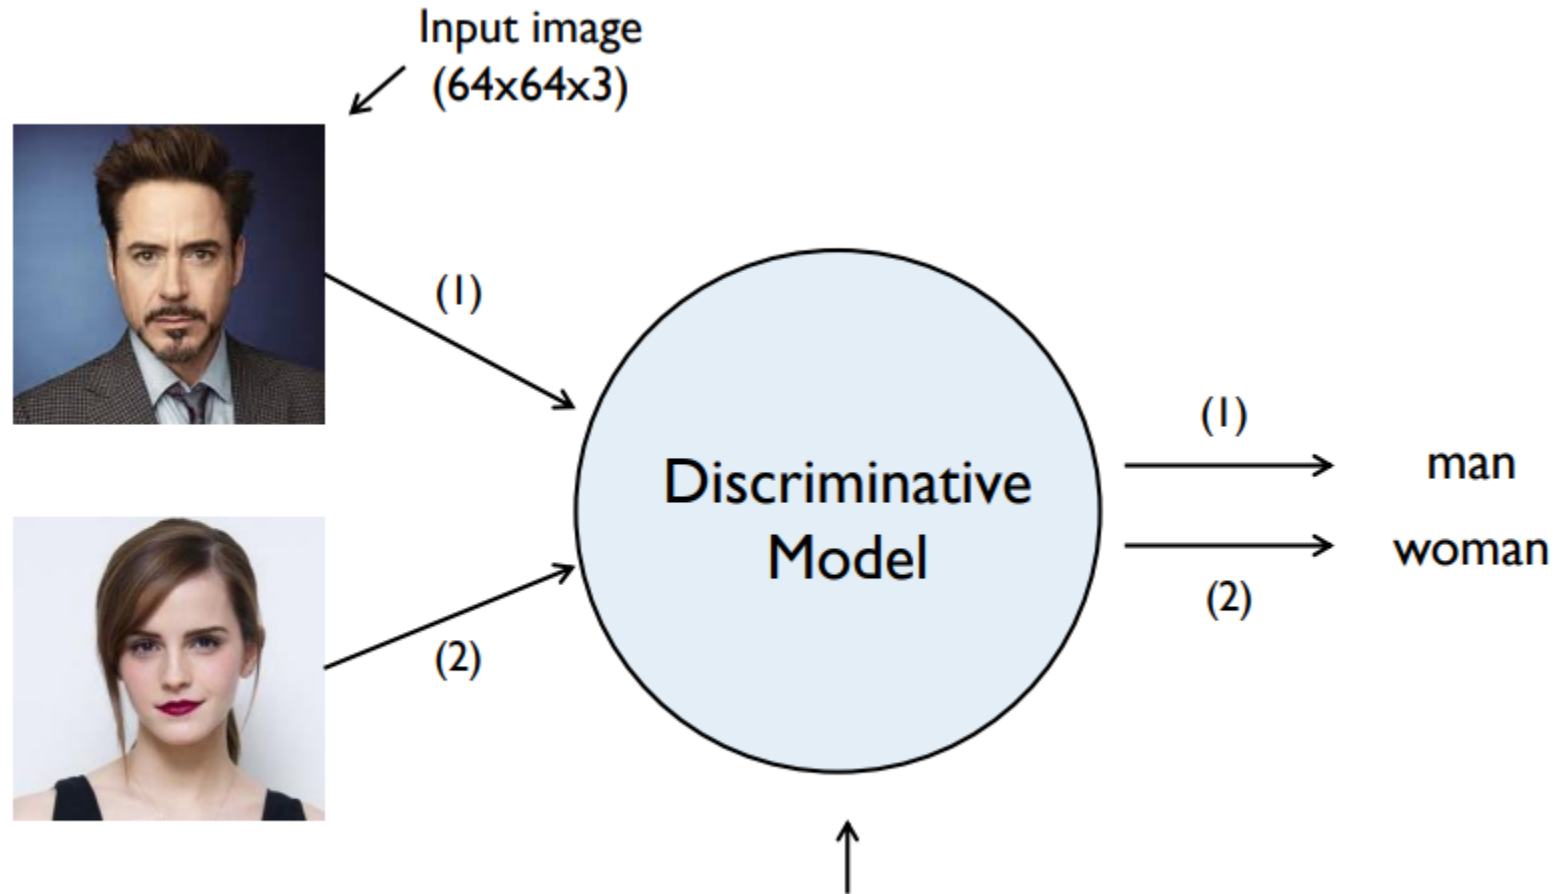

Introduction

Introduction

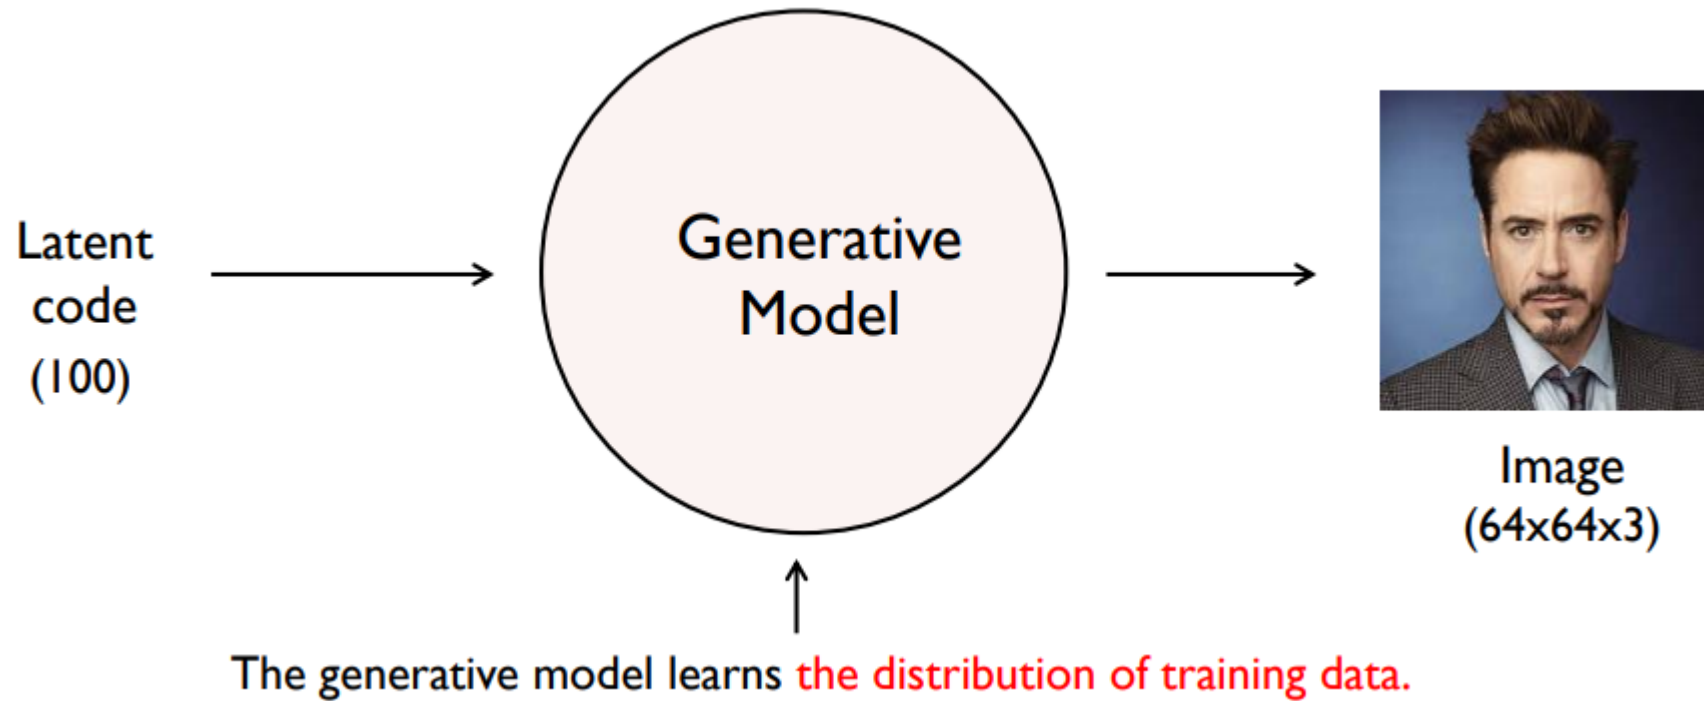

Introduction – Supervised Learning

The discriminative model learns **how to classify** input to its class.

Introduction – Unsupervised Learning

Introduction – Unsupervised Learning

- supervised learning 보다 더 challeng하다 :
 - label이 없다 → self learning
- Some NN solutions :
 - Boltzmann machine
 - AE or VAE
 - GAN

Generative Adversarial Network

GAN – Generative model

What if x is actual images in the training data?

At this point, x can be represented as a (for example) 64x64x3 dimensional vector.

GAN – Generative model

Probability density function

There is a $p_{data}(x)$ that represents the distribution of actual images.

GAN – Generative model

Let's take an example with human face image dataset.
Our dataset may contain few images of **men with glasses**.

x_1 is a 64x64x3 high dimensional vector
representing **a man with glasses**.

GAN – Generative model

Our dataset may contain many images of **women with black hair**.

x_2 is a 64x64x3 high dimensional vector representing **a woman with black hair**.

GAN – Generative model

Our dataset may contain very many images of **women with blonde hair**.

x_3 is a 64x64x3 high dimensional vector representing **a woman with blonde hair**.

GAN – Generative model

Our dataset may not contain **these strange images**.

x_4 is an 64x64x3 high dimensional vector representing **very strange images**.

GAN – Generative model

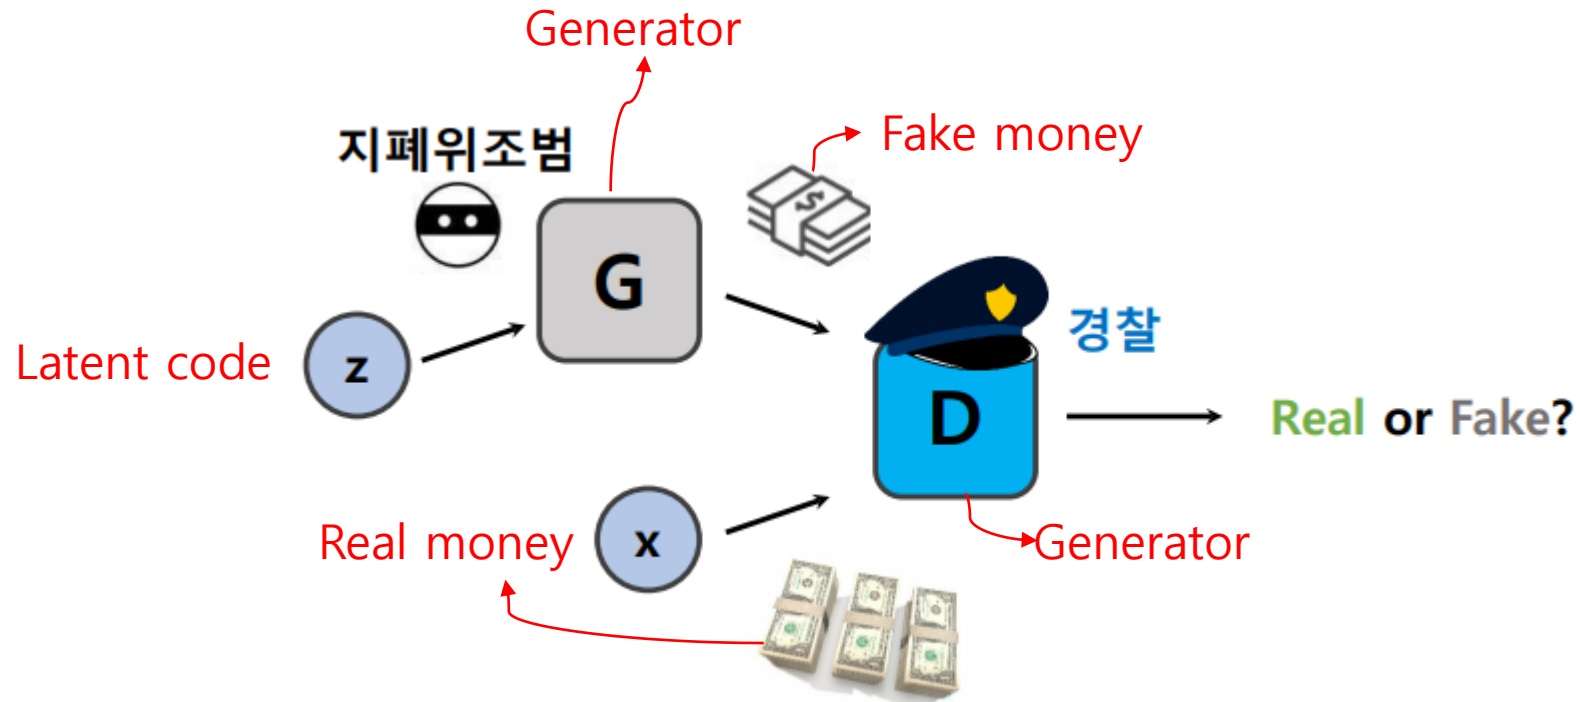

The goal of the generative model is to find a $p_{model}(x)$ that approximates $p_{data}(x)$ well.

GAN – Objective Function

- Minimax problem of GAN

$$\min_G \max_D V(D, G) = \mathbb{E}_{\mathbf{x} \sim p_{\text{data}}(\mathbf{x})} [\log D(\mathbf{x})] + \mathbb{E}_{\mathbf{z} \sim p_{\mathbf{z}}(\mathbf{z})} [\log(1 - D(G(\mathbf{z})))]$$

- 2단계의 증명이 필요
 1. GAN의 Minimax problem은 $\mathbf{p}_g = \mathbf{p}_{data}$ 일때 global optimum을 가짐
 2. global optimum 일 때 적절한 알고리즘을 찾을 수 있다

GAN – Objective Function(optimal D)

$$\min_G \max_D V(D, G) = \mathbb{E}_{\mathbf{x} \sim p_{\text{data}}(\mathbf{x})} [\log D(\mathbf{x})] + \mathbb{E}_{\mathbf{z} \sim p_{\mathbf{z}}(\mathbf{z})} [\log(1 - D(G(\mathbf{z})))]$$

에서 G가 고정되어 있을 때, 최적화된 D(목적함수의 미분값이 0)는

$$D_G^*(x) = \frac{p_{\text{data}}(x)}{p_{\text{data}}(x) + p_g(x)}.$$

$$\begin{aligned} C(G) &= \max_D V(G, D) \\ &= \mathbb{E}_{x \sim p_{\text{data}}} [\log D_G^*(x)] + \mathbb{E}_{z \sim p_z} [\log(1 - D_G^*(G(z)))] \\ &= \mathbb{E}_{x \sim p_{\text{data}}} [\log D_G^*(x)] + \mathbb{E}_{x \sim p_g} [\log(1 - D_G^*(x))] \\ &= \mathbb{E}_{x \sim p_{\text{data}}} \left[\log \frac{p_{\text{data}}(x)}{p_{\text{data}}(x) + p_g(x)} \right] + \mathbb{E}_{x \sim p_g} \left[\log \frac{p_g(x)}{p_{\text{data}}(x) + p_g(x)} \right] \end{aligned}$$

GAN – Objective Function(global minimum)

global minimum은 $C(G)$ 가 $p_g = p_{data}$ 가 되면 된다.

이 때 $C(G) = -\log 4$

For $p_g = p_{data}$, $D_G^*(x) = \frac{1}{2}$ and

$$C(G) = \mathbb{E}_{x \sim p_{data}} [-\log(2)] + \mathbb{E}_{x \sim p_g} [-\log(2)] = -\log(4).$$

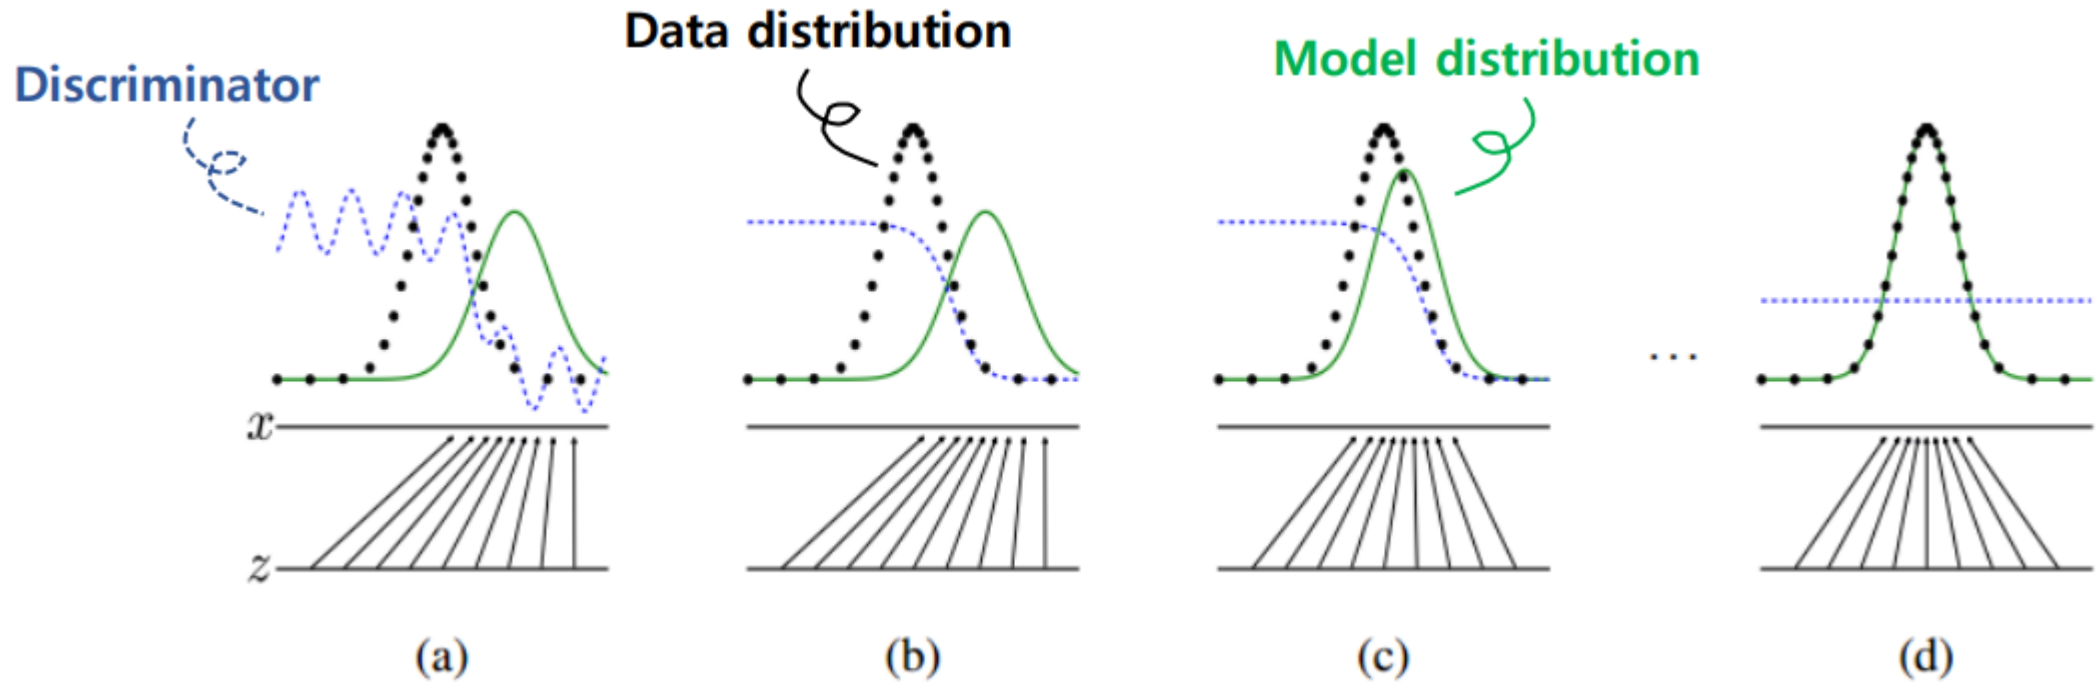

To show that this is the best possible value of $C(G)$:

$$\begin{aligned} C(G) &= -\log(4) + KL \left(p_{data} \parallel \frac{p_{data} + p_g}{2} \right) + KL \left(p_g \parallel \frac{p_{data} + p_g}{2} \right) \\ &= -\log(4) + 2 \cdot JSD(p_{data} \parallel p_g). \end{aligned}$$

$C(G)$ 가 앞의 수식을 변형한 식이 되고 $JSD(p_{data} \parallel p_g) \geq 0$ 이므로

$C(G)$ 의 global minimum은 $-\log 4$ 가 되고 이것은 $p_g = p_{data}$ 일때만 가능

GAN – Objective Function

GAN 의 한계

- 항상 optimal한 Discriminator를 만들어 내기가 힘들다.
 - Discriminator가 optimal 하지 않은 경우 generator가 discriminator가 구분하지 못하는 data를 계속 만들어 낼 수 있다.(mode collapse)
- 큰 수의 data set을 필요로 한다.
- Diminished gradient : discriminator가 너무 완벽하면 generator의 gradient 사라짐
- 학습이 어렵다
- 텍스트를 생성하는데 적용이 어렵다.
- GAN의 결과물 자체가 새롭게 만들어진 sample이라서 기존 sample과 비교하여 얼마나 비슷한 지를 확인할 수 있는 정량적 척도가 없고, 어떤 형태로 그 결과가 나오게 되었는지 그 과정을 알 수 없다.

Thank you
